

## **Instructions for Configuring SP1 remote control for Discrete Power-On or Toggle Power-On**

1. If the unit is on, put the SP1 in the standby mode by pressing the momentary toggle switch labeled 'POWER'
2. From the standby mode, turn the Main Power Switch at the rear of the unit to the OFF position. The standby LED on the front panel will go dark.
3. Hold down the POWER toggle on the front panel while pressing the Main Power Switch at the rear into the ON position.
4. Now you can let go and grab the remote control.
5. A) if you want the SP1 to power up discretely with the source buttons, hold down the TV button until the Standby/IR LED flashes and the unit powers up. B) if you want the PWR button on the remote to act as a toggle function, press the PWR button until the Standby/IR LED flashes and the unit powers up.

During this procedure, the SP1 will automatically 'learn' the address of the transmitting remote control, and store it in EEPROM.
